Professional Summary

Frontend Developer with over 3 years of experience building production web applications and business systems with React. I work in a small software house, where I take part in projects for different clients and industries, giving me the opportunity to work on a wide range of real business problems. Experienced in designing interfaces in Figma, developing applications from scratch, integrating APIs, and managing complex application state with Redux Toolkit.

Employment History

Frontend Developer, Stroyec

Jan 2023 – Present  Krakow

- Analyzed business processes directly with clients by talking to managers and team leaders, turning their requirements into UI solutions in Figma and creating complete, interactive prototypes covering views, forms, routing, interface states, and animations. After client approval, independently implemented the designed solutions in React.
- Developed and maintained a WMS/ERP system originally created for **Yujin Technology**. Worked on the first version of the system for around one year and continued developing and adapting it for other clients. The system covers warehouse, production, accounting, and quality processes and is currently used by around **150-200 users**.
- Designed and implemented a quality management module from scratch, allowing users to record product inspections, manage product statuses, block products from shipment, unblock them, and track the history of changes including the user and time of each operation. The module was integrated with warehouse, production, and shipping processes.
- Designed and implemented a delivery planning system for **DSC Poland**, allowing managers to enter expected deliveries in advance. Integrated it with the goods receiving process so warehouse employees could automatically fill in delivery data, including the date, contractor, products, and quantities, and modify the data when the actual delivery was received.
- Improved the product labeling process by automatically starting label printing immediately after creating finished components. The solution removed the need to manually search for products in a separate form and was integrated with the API responsible for providing the data required to generate labels.
- Designed and implemented complex forms and managed their state using **Redux Toolkit**, including dynamic management of materials, quantities, alternative material groups, filtering, and sorting. Improved application performance by creating a layer responsible for loading shared data once and reusing it across multiple modules.
dictionaries
- Implemented advanced interface features, including resizable columns in large data tables and layout stabilization during user interaction. The solution included handling column resizing, controlling column dimensions, and keeping the table's scroll position stable.
- Built the frontend of **k-scope** and **k-erp** from scratch. For k-scope, designed and implemented an interface for presenting company data, financial reports, charts,

tables, and a custom interactive map based on GeoJSON data, including support for Korean users. For k-erp, built a production application with Google Authentication, a system request form, API integration, state management using Redux Toolkit and React Context, and request status tracking.

Technologies: React, JavaScript, Redux Toolkit, React Router, React Context API, React Redux, styled-components, React Select, jsPDF, jsPDF AutoTable, QRCode, XLSX, JSZip.

IT Specialist , Panasia Polska

Jun 2024 – Present 📍 Warszawa

- Provided daily support to users with hardware, network, and system issues, as well as configured and deployed computer workstations, including preparing laptops for warehouse employees.
- Designed and reorganized the company's network infrastructure by planning the placement of routers, range extenders, and switches and organizing the existing infrastructure. Ensured stable Wi-Fi access across the office, warehouse, and outdoor areas, allowing employees to use company systems throughout the facility.
- Built an internal **React** tool from scratch for automatically generating product offers in PDF. The application uses a local JSON product database containing product names, prices, weight, quantities per carton, and related product images. Users can select products, modify their prices, names, and contact details, and generate a ready-to-use offer by converting the prepared HTML to PDF. The tool replaced the previous manual process of creating offers and significantly reduced the time needed to prepare them.

Technologies: React, JavaScript, JSON, HTML, CSS

IT Specialist / Process Automation , LG CNS

Jan 2023 – Jun 2024 📍 Wrocław

- Analyzed business processes within the administration department, gathered requirements directly from users, and designed and implemented tools to automate repetitive tasks and improve the daily work of a team of around **30 people**.
- Created automation tools from scratch using **Excel VBA**, **Power Query**, and **C#** to address specific user needs, including report automation, data processing, process control, and eliminating manual and time-consuming tasks.
- Built a desktop application from scratch for managing the inventory of cleaning supplies used by cleaning companies. The application supported inventory management, recording incoming and outgoing goods, selecting products and quantities when taking supplies, keeping a history of operations, and automatically generating issue documents for signing.
- Built a **VBA** tool from scratch for managing the company's vehicle fleet. The tool allowed users to record vehicle rentals, users, mileage, and the number of kilometers driven, as well as monitor the current use of company vehicles.
- Designed and created **Power BI** dashboards for ongoing monitoring of operational data and processes. Prepared dashboards for continuous display on screens within the department.
- Created tools supporting the search and analysis of messages in **Microsoft Outlook**, data control, process monitoring, and operational reporting, including automation of recurring reports that were previously prepared manually by users.

Technologies: Microsoft Excel, VBA, Power Query, Power BI, C#, Microsoft Outlook

Education

Polish-Japanese Academy of Information Technology (PJAiT), Bachelor of
Engineering in Computer Science

Sept 2025 — Present • Warsaw

SWPS University, Bachelor's Degree in Psychology

Sept 2019 — Jun 2022 • Wrocław
